

# TAKING AND ANALYSING BLOOD SAMPLES AT HOME

## WHAT?

The project is examining ways in which patients themselves can take blood samples and get the blood analysed at home and/or somewhere other than at the hospital.

## WHY?

Currently, a large number of patients have to make many additional visits to hospital to provide blood samples. There is a need to reduce these visits, create more patient empowerment, and reduce the hospital's staff costs for taking and analysing blood samples.

## WHO?

This is a public-private innovation partnership. The project includes the Capital Region of Denmark Centre for Telemedicine, health-care professionals and patients from the Rheumatology and Endocrinology Department at Frederiksberg/Bispebjerg Hospital, and the Gastro Unit, Paediatric Department and Maternity Unit at Herlev Hospital. It is planned to include Siemens Healthcare in the project.

## EXPECTED RESULTS:

- Conceptual specification for device and software developed on the basis of an in-depth user survey.
- Market analysis of existing blood testing products.
- Business case, to assess the potential for developing, selling and purchasing such a solution.
